- wasted space bet. filter & housing →
 - a. provide insulative material to occupy space.
 - b. use centrifugal action of oil flow in space to swing out particles.
 - c. Add extra filter element around mid core.
- Oil pressure inline lets contaminants drain back to engine.
 - a. provide coiled tube w/ holes for oil exit & dispersion.
 - disperses heat from incoming oil, providing less element melting.
- If filter is snug against evaporation tube, and holes are at top of tube → filter life compromised and oil stagnation results. If oil drains back down through filter (holes at bot. of tube) → easy inspection of filter element.
